Organizing and Segmenting the Body element

HTML5 introduced new semantic elements for organizing and segmenting content within the body section of the HTML document. Below is an example:

```
1.  <!DOCTYPE html>
2.  <html lang="put your primary language code here, such as 'en'
    for english">
3.    <head>
4.      <meta charset="UTF-8">
5.      <title>Bookmark name and SEO topic goes here</title>
6.    </head>
7.    <body>
8.      <header>
9.        Content that heads the page goes here. This is usually content
          such as a banner, logo, or text that will be at the top of every
          page.
10.     </header>
11.     <nav>The website's navigation system goes here</nav>
12.     <main>
13.       Each page's primary content goes here. This should be content
          that is unique to each page.
14.     </main>
15.     <footer>
16.       Content that sits at the bottom of every page goes here. Common
          footer content would be a website's contact information, or a
          secondary navigation system for accessing informational pages
          such as FAQ, company history, or a company directory.
17.     </footer>
18.   </body>
19. </html>
```
