Display

Styling	Property	Values	Comments
Display Settings	display	block	defines an element as a block element
		list-item	defines an element as a list item
		inline	defines an element as a inline element
		none	prevents element from displaying; treating the element as if it did not exist on the page.
		inline-block	The element is placed as an inline element (on the same line as adjacent content), but it behaves as a block element
		inline-table	The element is displayed as an inline table
		table	The element is displayed as a table
		table-caption	The element is displayed as a table caption
		table-cell	The element is displayed as a table cell
		table-column	The element is displayed as a table column
		table-column-group	The element is displayed as a table column group (like <colgroup>)
		table-footer-group	The element is displayed as a table footer row group
		table-header-group	The element is displayed as a table header row group
		table-row	The element is displayed as a table row
		table-row-group	The element is displayed as a table row group
		inherit	The value of the display property will be inherited from the parent element
